

d

c

b

a

1. define:

h = height of BT tower

H = altitude of airplane

P = absolute parallax

dP = parallax difference between bottom and top of BT tower

then:

$$h/H = P/(P+dP)$$

2. $H = 660\text{m}$

$$P = c-a = 36-13 = 23$$

$$dP = d-b = 18-8 = 10$$

3. $h = H \times dP / (P+dP) = 660\text{m} \times 10 / 33 = 200\text{m}$
